

H4000 SILICONE SPRAY

The merits of a high quality non-staining silicone spray, especially when protecting expensive fishing gear, is known by many experienced anglers. Helmar's Australian made H4000 food grade silicon spray provides a protective coating that shields fishing rods and reels from the corrosive effects associated with saltwater environments. Leather gimbal belts may also receive a generous coating for a lusty shine whilst repelling salt water. Filleting knives are well catered for with a light spray prior to packing the knife away, keeping corrosion away and a keen working edge on the blade, with the coating wiped off before using the knife.

The trusty old sea going outboard is undoubtedly well and truly in the thick of it with saltwater spray and its uncanny ability to find its way into every conceivable part of the power

head, air intake and electronics. Helmar's H4000 is a spray that assists in reducing the effects of saltwater ingress and corrosion while also providing lubrication to throttle arms and other moving parts of the engine, without attacking expensive electronic leads and components. This product would have to be in anyone's book, very cheap insurance.

Next issue we will take a look at benefits of Helmar H4000 Silicone Spray and its uses when reloading.
